Type of Business Management

Education Operational CRM

Designed to help educational institutions manage and strengthen relationships between students, advisers, and administrative staff by centralizing academic communication, progress tracking, and feedback processes within a single platform.

Tools Needed

- **Visual Studio 2022** – IDE used for building the desktop application using C# programming language.
- **Microsoft SQL Server** – Serves as the primary database management system for storing student and admissions data.
- **Microsoft SQL Server Management Studio** – an integrated environment used to manage, configure, and administer all aspects of a Microsoft SQL Server infrastructure.
- **Figma** – For creating user interface wireframes and prototypes during the design phase.
- **Clickup** – A productivity tool is used to efficiently manage project tasks, timelines, and collaboration among team members.

Technologies

- **Gmail API** – Enables automated email notifications, announcements, and inquiries.
- **Twilio API / Textbelt (Alternative)** – Handles SMS-based notifications for reminders and updates.
- **Guna UI Framework** – To enhance user interface design and modernize the system's look and feel.

Target Users

- **Students** – to access academic information, receive updates, and communicate with their assigned advisers for course-related concerns.
- **Advisers** – can manage assigned student profiles, send announcements or messages, provide academic updates, and respond to student concerns or inquiries.
- **Administrative Staff** – serve as system overseers responsible for account management, data monitoring, report generation, and ensuring proper operation and coordination between students and advisers.

Subs Systems

Communication & Engagement System (Automated Messaging)

- Handles student-related announcements, reminders, and personalized messages via email or in-app notifications.
- Supports direct messaging between students and advisers for academic or advisory purposes.

Customer Service & Support

- Allows students to raise concerns or submit requests through a ticketing system.
- Enables advisers and staff to track, respond to, and resolve student issues efficiently.
- Collects student feedback to help assess satisfaction and improve services.

Project Objectives

1. To streamline student relationship management

Develop a centralized platform for managing student profiles, communications, and academic interactions between students and advisers.

2. To enhance communication and engagement

Implement in-app and email-based communication features that support timely, course-related exchanges between students and advisers.

3. To improve student support and satisfaction

Provide a feedback and ticketing system that allows students to report issues, request assistance, and track responses from advisers or staff.

4. To simplify administrative tasks

Reduce manual workload by digitizing key student–adviser processes such as concern reporting, updates, and message management.

Project Description

The proposed project aims to develop a **Student–Adviser Relationship Management System**, an educational Customer Relationship Management (CRM) platform designed to enhance communication, support, and engagement within an academic setting. The system focuses on facilitating meaningful interactions between students, advisers, and staff to improve academic guidance and student satisfaction.

It allows **students** to receive course-related announcements, send messages, and raise support tickets or feedback through a unified platform. **Advisers** can manage student inquiries, provide academic updates, and respond to submitted concerns, ensuring consistent and timely guidance.

The **administrative staff** oversee and manage the system's overall operations. Their responsibilities include maintaining user accounts, monitoring message or ticket activity, generating summary reports, and ensuring that communications within the system remain organized and professional. They act as system moderators and support personnel, helping both students and advisers when technical or administrative issues arise.

The system aims to serve as **a centralized and efficient platform for student relationship management** — simplifying communication, tracking student progress, and addressing academic concerns. By integrating structured messaging, notification, and feedback features, the project seeks to reduce communication gaps between students and advisers while promoting transparency and timely response.

This CRM platform also intends **to improve institutional productivity** by digitizing essential processes such as concern management, message handling, and record updates. Through its user-friendly interface and intuitive navigation, the system ensures ease of use and accessibility even for users with basic digital literacy.

Ultimately, the Student–Adviser Relationship Management System promotes a more connected, supportive, and responsive academic environment that enhances both the student experience and adviser efficiency.

The development of the Educational CRM system will utilize a set of modern software technologies to ensure reliability, usability, and maintainability. The primary development environment will be **Visual Studio 2022**, using the **C# programming language** for building the system's core logic and functionalities. The **Guna UI Framework** will be integrated to enhance the graphical interface, providing a modern and user-friendly design experience.

For data storage and management, the system will use **Microsoft SQL Server** as the main database, managed through **SQL Server Management Studio (SSMS)**. Additionally, **Figma** will be used for designing the user interface prototypes and wireframes during the planning and design phase.

These technologies were chosen based on the course description and requirements of **IT13L – IT Professional Track 4**, which focuses on the application of the specified tools and frameworks in system development. They align with the project requirements as they are well-suited for creating **Windows-based applications**, which matches the environment of most target users who primarily use Windows computers. Additionally, these technologies are **optimized for Windows development**, ensuring better performance, compatibility, and ease of deployment.
